Assignment 2

September 30, 2024

Question 1 (35 Points). Three airports in New York City run 24 hours a day, 7 days a week. In a given day, there are requirements for the total number of air traffic controllers that must be at the airports. These are given in Table 1.

Air traffic controllers can either work 8-hour or 12-hour shifts, starting at the times stated earlier (12-hour shifts can start only at 12 a.m./p.m. or 8 a.m./p.m.). Those working 8-hour shifts cost \$40/h in salary and benefits, and those working 12-hour shifts cost \$35/h.

- 1. Formulate and solve a linear program to minimize the dispatcher labor costs. [20 pts]
- 2. Suppose at most one-third of its controllers can work 12-hour shifts. Repeat (1). You may ignore the requirement that the number of employees must be an integer. [15 p]

Hours	Controllers needed
12 a.m. to 4 a.m.	8
4 a.m. to 8 a.m.	10
8 a.m. to 12 p.m.	16
12 p.m. to 4 p.m.	21
4 p.m. to 8 p.m.	18
8 p.m. to 12 a.m.	12

Table 1: Number of controllers needed during different time intervals.

Assignment 2

September 30, 2024

Question 2 (10 Points). Consider the LP below and write out its dual. Solve the LP and its dual via your favorite solver. State whether the optimal solution for primal and dual problem yield to the same optimal value.

$$max \ Z = 10x_1 + 14x_2 + 20x_3$$

$$s.t. \ 2x_1 + 3x_2 + 4x_3 \le 220$$

$$4x_1 + 2x_2 - x_3 \le 385$$

$$x_1 + 4x_3 \le 160$$

$$x_1, x_2, x_3 \ge 0$$

Assignment 2

September 30, 2024

Question 3 (55 Points). Suppose that a lumberyard has a supply of 10-ft boards, which are cut into 3-ft, 4-ft, and 5-ft boards according to customer demand. The 10-ft boards can be cut into several sensible patterns, each in such a way that there the leftover material is less than 3-ft. The lumberyard just received an order for 90 3-ft boards, 60 4-ft boards, and 60 5-ft boards.

- 1. Determine all sensible patterns the lumberyard may use to cut the 10-ft boards. [10 pts]
- 2. The lumberyard would like to use as few 10-ft boards as possible in meeting the demand.
 - (a) Write out a mathematical formulation for the problem as an integer linear program.

 [10 pts]
 - (b) Solve this problem using Gurobi solver via the Python interface. What is the optimal number of each pattern, and what is the minimum number of boards to cut? [15 pts]
- 3. If it is possible to maintain the minimum number of 10-ft boards to be used, the lumberyard would also like to minimize the amount of scrap pieces leftover (those pieces smaller than 3-ft).
 - (a) With respect to the previous solution, model this desire algebraically. [10 pts]
 - (b) Modify the model and resolve it. Summarize the results here. [10 pts]

    print(f"\t x4 (Two 5-ft boards): {x4.x}")
    print(f"\t x5 (One 3-ft and one 5-feet board): {x5.x}")
    print(f"\t x6 (Two 3-ft and one 4-feet board): {x6.x}")
    print(f"\nTotal 10-ft boards used: {m.objVal}")
    total scrap = 1*x1.x + 2*x2.x + 1*x3.x + 0*x4.x + 2*x5.x + 0*x6.x
    print(f"Total scrap: {total_scrap} feet")
else:
    print("No optimal solution found.")
Optimal solution found:
         x1 (Three 3-ft boards): -0.0
         x2 (Two 4-ft boards): 7.0
         x3 (One 5-ft and one 4-ft board): -0.0
         x4 (Two 5-ft boards): 30.0
         x5 (One 3-ft and one 5-feet board): -0.0
         x6 (Two 3-ft and one 4-feet board): 46.0
Total 10-ft boards used: 83.0
Total scrap: 14.0 feet
               Using this approach, we managed to use as many 10 ft boards and reduce by 2 ft the
               amount of snap done by the outs.
```
